

# Sample Article - How to Build a Greener Office Without Greenwashing

---

\*Training sample for fictional EcoDesk. Review and verify before real publication.\*

## Quick answer

Use a staged prompt workflow to create an answer-first article from a verified brief and claim ledger. The useful outcome is a clear, evidence-based page that helps a defined reader make a better decision.

## Why this matters

Helpful content is created primarily to benefit people; AI-assisted content still needs originality, accuracy, transparent authorship and appropriate expertise.

## A practical framework

1. Define the audience, intent and desired action.
2. Gather current first-party data and authoritative guidance.
3. Use AI to generate options, clusters or drafts within constraints.
4. Verify claims, calculations, accessibility and source implementation.
5. Publish after human approval, then measure outcomes and guardrails.

## EcoDesk example

EcoDesk wants a practical guide for Singapore SME office managers who need credible sustainability actions without exaggerated claims.

## What to avoid

- Invented performance, certifications, reviews or environmental impact.
- Repetitive keywords that make the page awkward or misleading.
- Generic AI prose without original evidence or a distinct reader decision.
- Automated publishing, outreach or technical directives without approval.

## Source and limitation

Primary learning source: <https://developers.google.com/search/docs/fundamentals/creating-helpful-content>

This sample uses synthetic business information. It promises no rankings, traffic, rich results or Google AI-feature inclusion.
