

Sample Article - What Is a Sustainable Office Setup? Singapore Guide

Training sample for fictional EcoDesk. Review and verify before real publication.

Quick answer

Create a clear, source-grounded page that can be indexed and understood by users and generative search features without relying on unsupported GEO hacks. The useful outcome is a clear, evidence-based page that helps a defined reader make a better decision.

Why this matters

Google says existing SEO best practices remain relevant for AI features, pages need no special AI markup, and inclusion is never guaranteed.

A practical framework

1. Define the audience, intent and desired action.
2. Gather current first-party data and authoritative guidance.
3. Use AI to generate options, clusters or drafts within constraints.
4. Verify claims, calculations, accessibility and source implementation.
5. Publish after human approval, then measure outcomes and guardrails.

EcoDesk example

EcoDesk wants to answer a complex planning query while avoiding inflated promises about appearing in AI Overviews or AI Mode.

What to avoid

- Invented performance, certifications, reviews or environmental impact.
- Repetitive keywords that make the page awkward or misleading.
- Generic AI prose without original evidence or a distinct reader decision.
- Automated publishing, outreach or technical directives without approval.

Source and limitation

Primary learning source: <https://developers.google.com/search/docs/fundamentals/ai-optimization-guide>

This sample uses synthetic business information. It promises no rankings, traffic, rich results or Google AI-feature inclusion.
